

English

Unit 1 - My World

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

I can use the key vocab to label a world map.

I can match world cities to their co-ordinates.

I can answer comprehension questions on a text.

WALT: WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Retrieval Practice - What tenses are the following sentences written in?

She will visit her grandparents next week

simple)

They have studied English for

perfect)

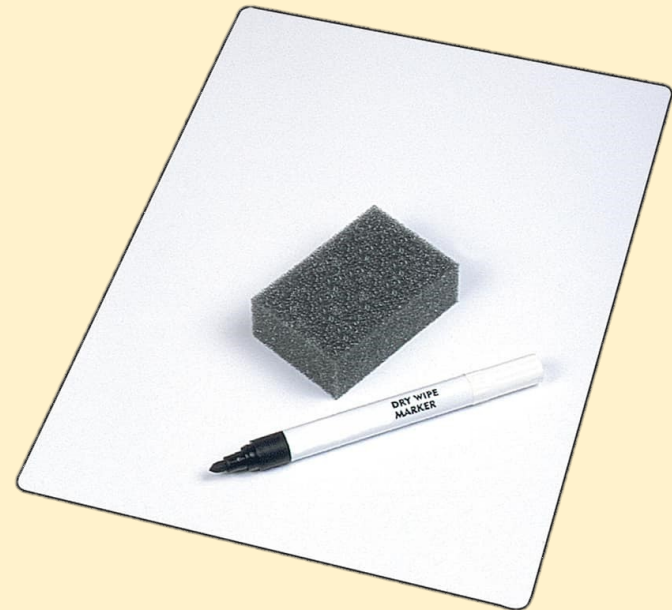

We went to the park yesterday

I am reading a book right now **(present continuous)**

Starter- Geography quiz!

On your whiteboards write the answers to these 5 questions.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Question 1:

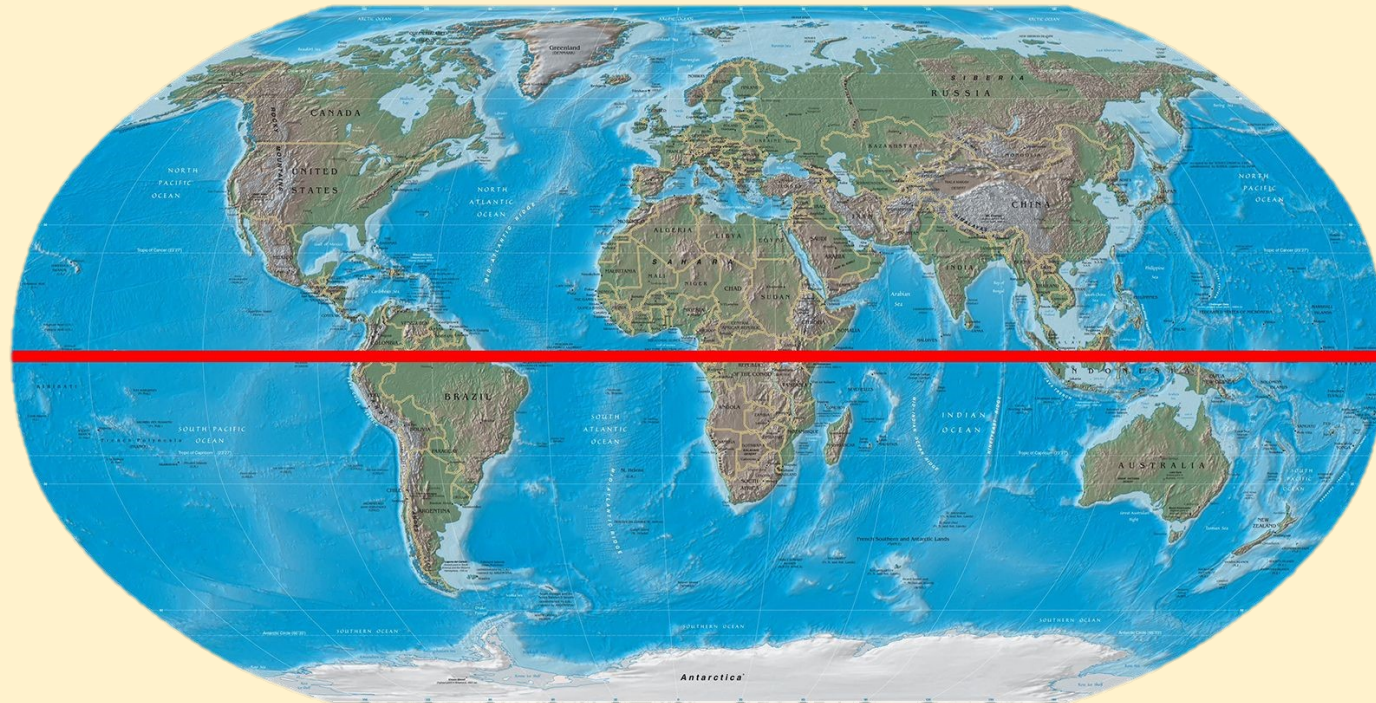

Is **London** an example of a district, town or city?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Question 2:

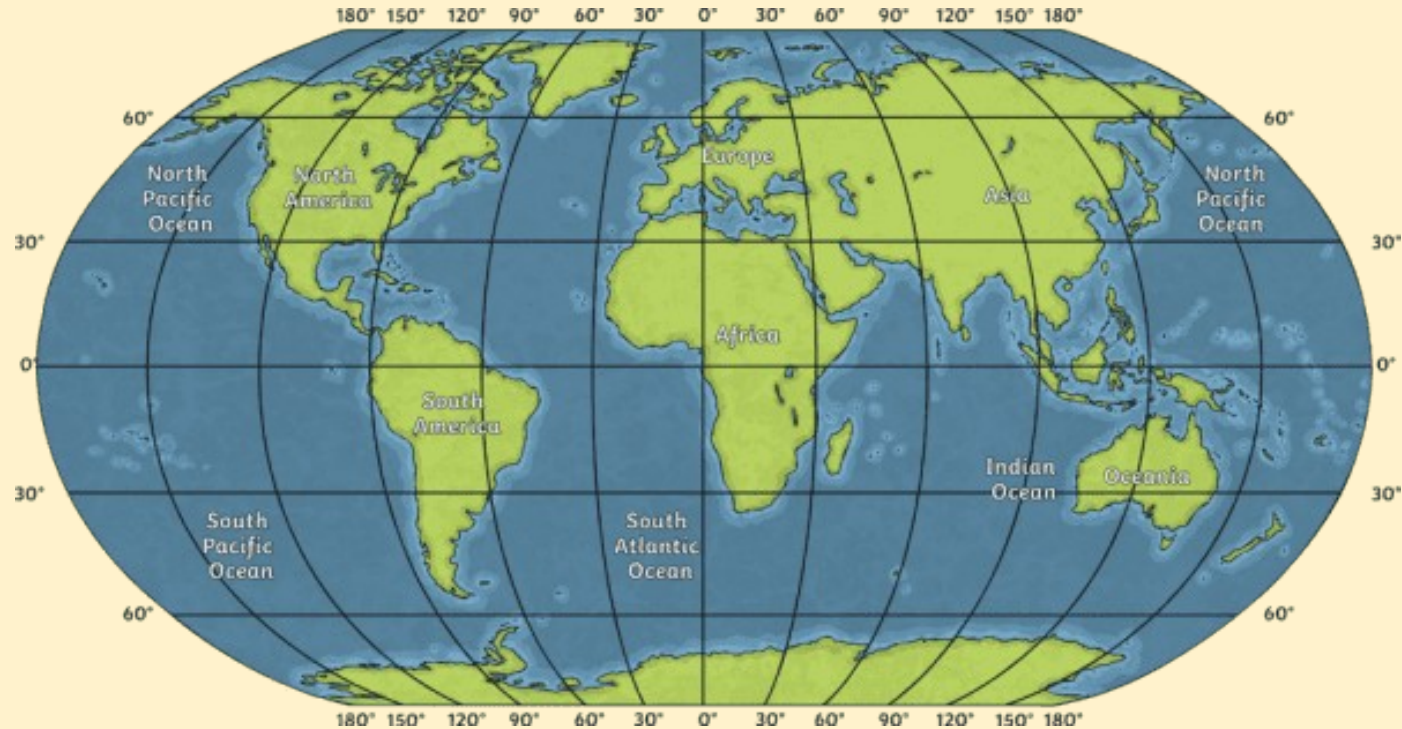

What do we call the imaginary line that runs around the middle of Earth?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Question 3:

Do lines of **longitude** run horizontally or vertically?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Question 4:

What is the most northern point of Earth called?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

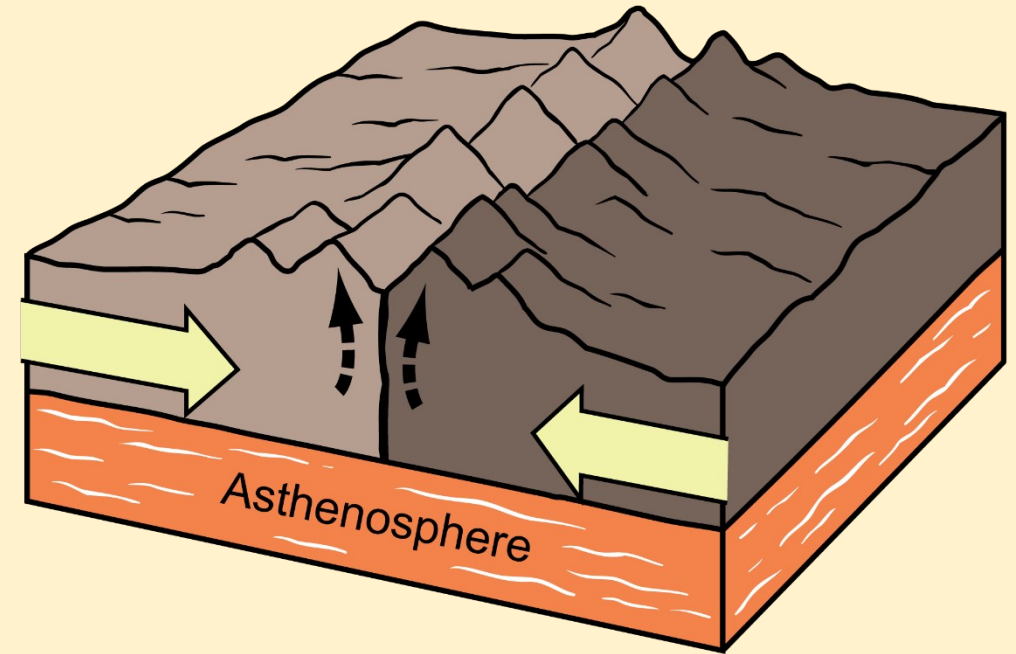

Question 5:

Which of the following is **not** a continent?

Asia

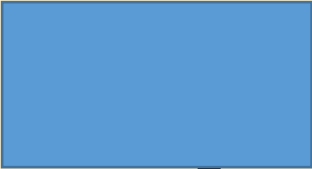

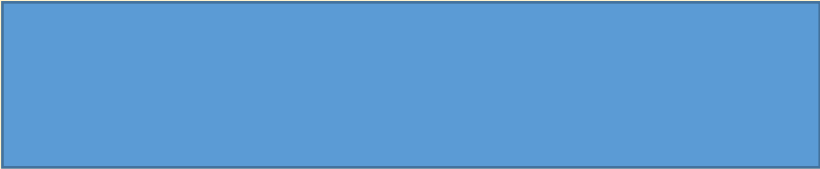

The Middle East

Africa

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Answers!

- 1) 
- 2) r
- 3) y

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

How can we tell people where in the world we are?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Look at this address of Vinschool
Metropolis.

**29 P. Liễu Giai, Ngọc Khánh, Ba Đình, Hà
Nội, Việt Nam**

**Which part of the address
is:**

Local ?

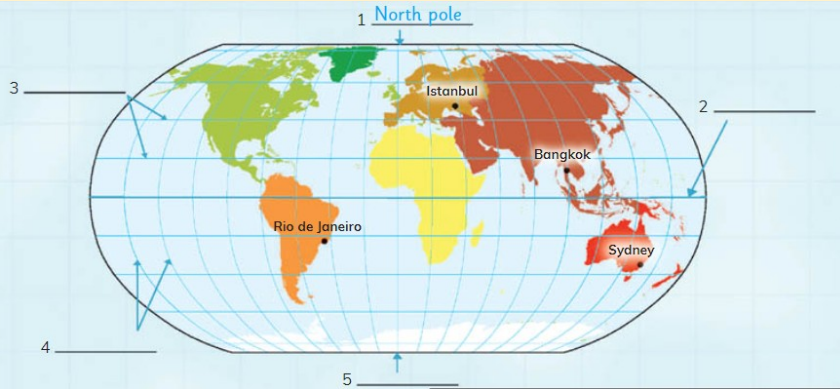

National?

International?

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Read the text independently now.

Planet Earth is huge, so how do we pinpoint the exact location of places on our planet?

We map the Earth's surface with lines called **latitude** and **longitude**. Imagine our planet as a huge ball or sphere. At one end is the **North Pole** and at the other, the **South Pole**. In the middle, circling the Earth between the two poles, is an imaginary line called the **equator**. Its line of latitude is zero **degrees** (0°). More lines of latitude circle the Earth from east to west, **parallel** to the equator. They are the same distance apart (about 111 km); each distance is measured in degrees, $0-90^\circ$ to the north and $0-90^\circ$ to the south.

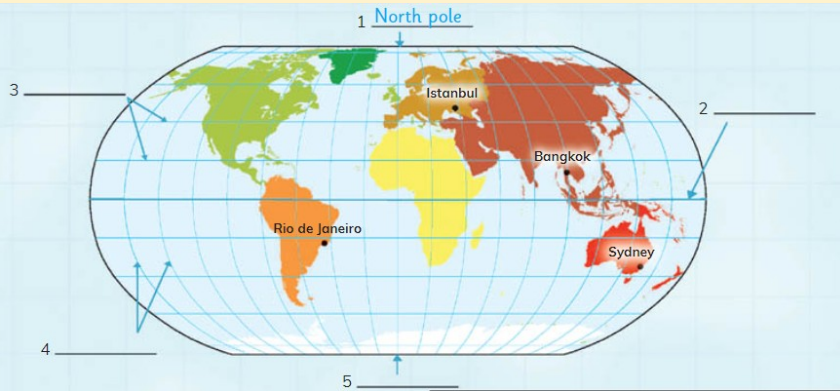

Lines of longitude run from the North Pole to the South Pole. The lines divide the Earth's surface into **vertical** sections, like pieces of an orange. These lines are measured in degrees too, $0-180^\circ$ to the east and $0-180^\circ$ to the west.

What happens when a location is between the lines? We divide the degrees into minutes and seconds, so the exact location can be found. This code is called a **coordinate**.

Remember that these are imaginary lines – you can't actually see them!

Use the word bank to complete labels 2 - 5 on the world map.

Read the text again and look at the world cities on the map in on page 15.
Match each city to a coordinate, a–d. Which countries are the cities in?

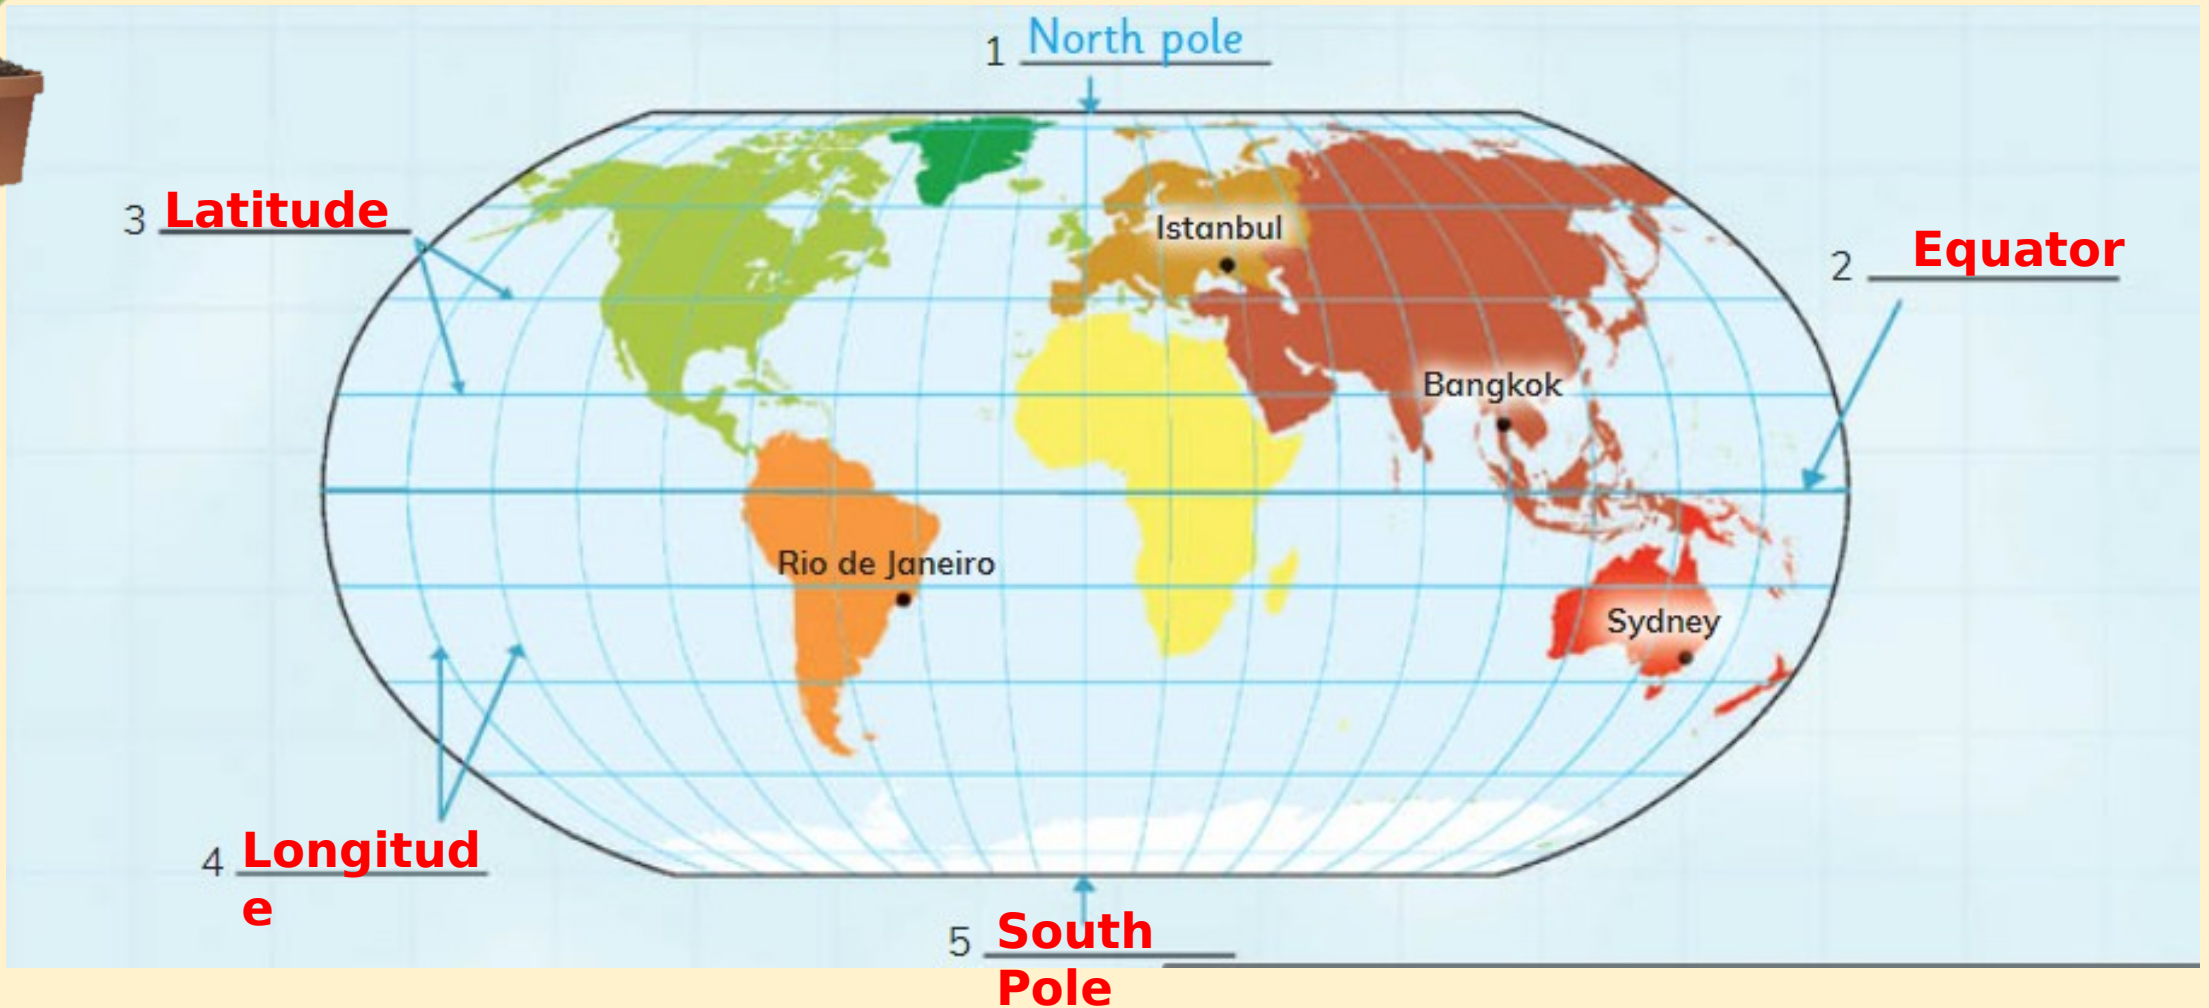

a 13° N 100° E **b** 33° S 151° E **c** 41° N 29° E **d** 23° S 43° W

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

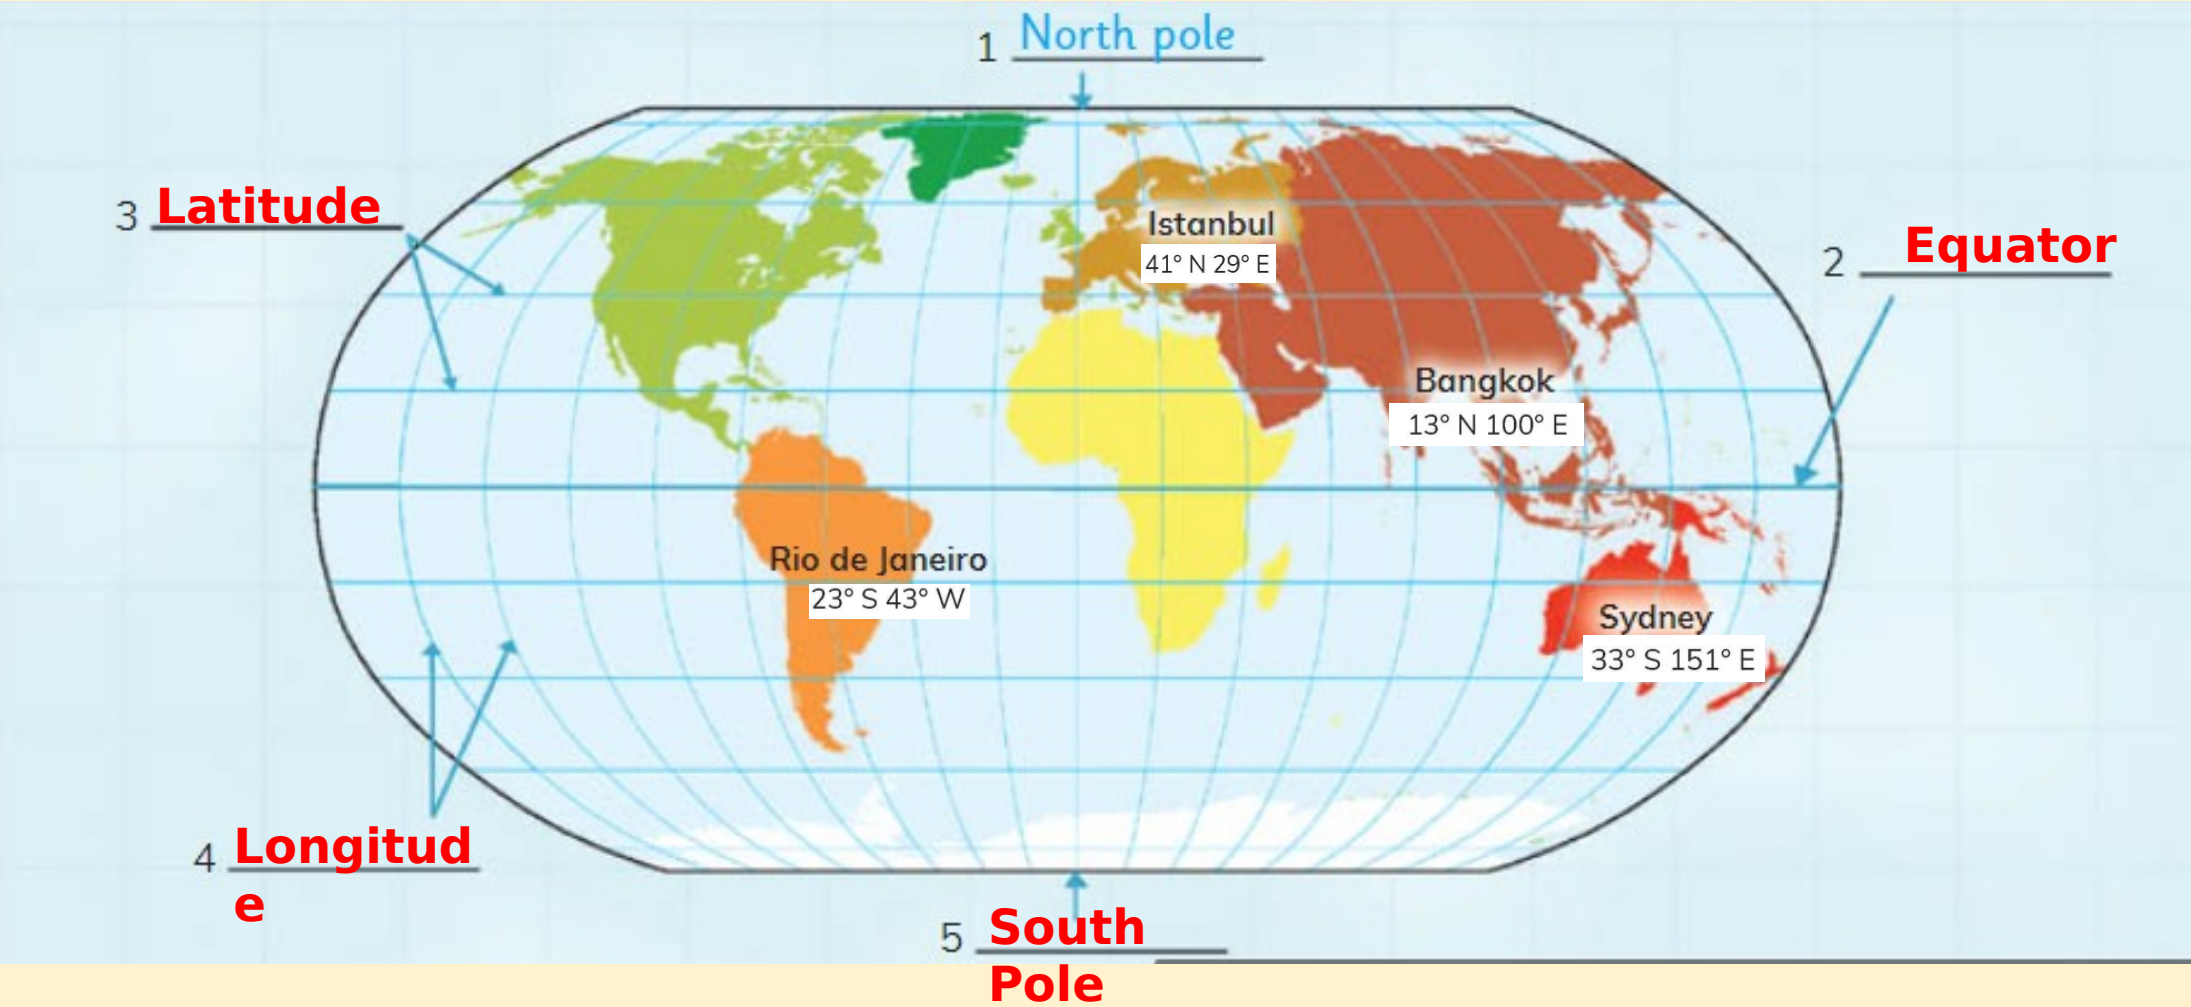

- **What imaginary line circles the Earth in the middle between the North and South Poles, and what is its degree measurement?**
- **How far apart are lines of latitude from one another, and how far north and south are they measured?**
- **What happens if a location is directly in between two-degree lines?**
- **What is the code called that identifies an exact location, and can you see these lines on the actual surface of the Earth?**

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

1. The equator, which has a latitude of 0° .
2. They are about 111 km apart and are measured from 0° – 90° to the north and 0° – 90° to the south.
3. The degrees are divided into smaller units called minutes and seconds.
4. The code is called a coordinate, and the lines cannot be seen in real life because they are imaginary.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

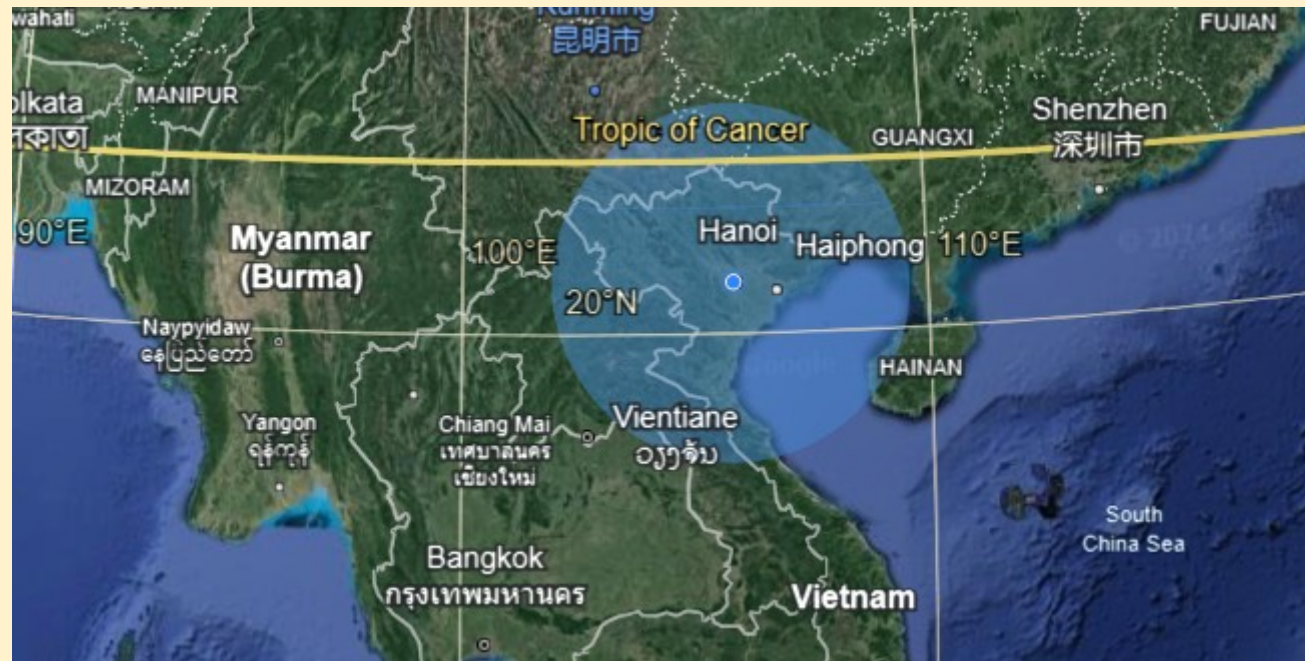

I can use the key vocab to label a world map.

I can match world cities to their co-ordinates.

I can answer comprehension questions on a text.

WALT: Understand, with support, most of the detail of an argument in short and extended texts.

Plenary – Let's see what interesting places in the world are on the same latitude and longitude as Hanoi.
